

# Auto Upi - Self Hosting Guide (Hinglish)

Is guide me step by step bataya hai: Supabase par database kaise banana hai, GitHub se Hostinger par one-click deploy kaise karna hai, aur admin kaise banana hai.

## Step 1 - Supabase project banao

1. supabase.com par login karo, **New project** banao (region: Mumbai).
2. Project Settings > API se ye 3 cheezein copy karo: **Project URL**, **anon/publishable key**, **service\_role key**. Project ref = URL ka pehla hissa (xxxx.supabase.co me xxxx).

## Step 2 - Database SQL chalao

1. Code me **database/setup.sql** file kholo.
2. Usme **is\_platform\_admin()** function me admin email ko apne email se badlo.
3. Same email **src/routes/admin.tsx** me **ADMIN\_EMAIL** me bhi daalo (dono jagah same hona chahiye).
4. Supabase > **SQL Editor** > **New query** - puri setup.sql paste karo > **Run**. Dobara chalana safe hai.

## Step 3 - Login settings

Supabase > Authentication > Providers > **Email** ON karo.

Authentication > URL Configuration: Site URL = <https://aapka-domain.com>, Redirect URLs me `/auth` aur `/reset-password` add karo.

## Step 4 - Code GitHub par daalo

Poora project apni GitHub repository me push karo (private repo chalega). `.env` file GitHub par mat daalo.

## Step 5 - Hostinger par deploy (one click)

1. Hostinger > **Web Apps Hosting** (Node.js) > **Add website** > **Import from GitHub**.
2. Apni repository aur branch (main) choose karo.
3. Settings ye rakho:

```
Framework / Preset : Other (Node.js)
Node version       : 22
Install command    : npm install
Build command      : npm run build:node
Start command      : npm run start
Output directory   : .output
```

4. **Environment variables** me ye add karo (apni values ke saath):

```
VITE_SUPABASE_URL=https://xxxx.supabase.co
VITE_SUPABASE_PUBLISHABLE_KEY=anon-key
VITE_SUPABASE_PROJECT_ID=xxxx
SUPABASE_URL=https://xxxx.supabase.co
SUPABASE_PUBLISHABLE_KEY=anon-key
SUPABASE_PROJECT_ID=xxxx
SUPABASE_SERVICE_ROLE_KEY=service-role-key
AUTOUPI_PLATFORM_API_KEY=aapki-api-key (Pro upgrade ke liye)
AUTOUPI_PLATFORM_WEBHOOK_SECRET=aapka-webhook-secret
```

5. **Deploy** dabao. Uske baad GitHub par jo bhi push karoge, Hostinger apne aap naya version deploy kar dega.

6. Domain connect karo (Hostinger > Domains) aur SSL ON rakho.

Note: service\_role key kabhi bhi VITE\_ se shuru mat karo - wo sirf server ke liye hai.

## Step 6 - Admin kaise banaye

1. <https://aapka-domain.com/admin> kholo.
2. Wahi email daalo jo setup.sql aur ADMIN\_EMAIL me daala tha, aur apna password choose karo.
3. Pehli baar sign in karte hi admin account apne aap ban jata hai. Doosre kisi email ko admin nahi banaya ja sakta.
4. Admin panel > **Email source** me apna Gmail + app password connect karo - isi se register OTP jayega.
5. Overview me Pro price set karo, Free plan switch on/off karo, Users me kisi ko Pro de sakte ho.

## Step 7 - Merchant setup (user side)

Register (OTP) > Connect Accounts me UPI ID + Gmail app password > Config me redirect/webhook URL > API Keys se key banao > Payment link generate karke test karo.

## Step 8 - Check list

- /register par account banao, Supabase > Table Editor > profiles me row aani chahiye.
- Payment link banao, Plan page par QR count badhna chahiye.
- /docs page khul raha hai.
- /admin me login ho raha hai.

## Problem aaye to

- Page blank / 500: Environment variables check karo, phir Redeploy.
- Login nahi ho raha: Supabase URL Configuration me domain sahi daalo.
- OTP nahi aa raha: Admin > Email source me Gmail app password dobara connect karo.
- Payment capture nahi: merchant ka Gmail app password galat/expire - reconnect karo.
